

INNfinity Automates the Bed Request

INNfinity Software Systems announces the release of a new product- the Housing Manager/LodgeLink Interface, for use with INNfinity V2 camp management software, that automates the bed request process between camp/lodge manager and paying client/contractor. Reservations can be created and manipulated in real-time by the paying client, eliminating the need to send a bed request to the lodge manager. INNfinity V2 further empowers the paying client with user-definable reports to monitor lodge allotments, resulting in increased camp occupancy. Meanwhile, managers can rest easy, as access to the interface is tightly secured and subject to user-definable business rules. With this level of control and detail at the fingertips of the paying client, the bed request paper trail is eliminated, saving time and work for both the manager and the client. Can't sleep? Up late counting bed requests? Ditch the sheep. Find peace with INNfinity V2's new Housing Manager/LodgeLink Interface.

Reservations

Managing reservations within an internally/externally managed lodge/camp is easily accomplished with INNfinity V2's new interface. No bed request required. For example, PTI Group, a supplier of remote-site workforce lodge accommodations, allocates a block of rooms to its paying client- Esso Imperial. Esso Imperial can login into the INNfinity Housing Manager/LodgeLink Interface, a web asp.net application, and view the real-time occupancy and

availability of their lodge allotment-located in PTI's facility. The Housing Manager/LodgeLink user interface is INNfinity's signature easy-to-use 1-screen design. Here Esso can ensure effective utilization of their allotments. Any unused rooms can be detected and instantly reported to the lodge manager assuring maximum lodge occupancy. The view from the Housing Manager/LodgeLink Interface can be further drilled-down to monitor allotments at a contractor level. With the big picture in sight, Esso Imperial can easily create, view, cancel, and change reservations in real-time through the Housing Manager/LodgeLink Interface without the time-consuming process of sending

time, a manager can review what was booked, changed, or cancelled and by whom. INNfinity V2's new Housing Manager/LodgeLink Interface provides Esso Imperial with the essential details to efficiently manage their lodge allotments.

Security

Because INNfinity V2's Housing Manager/LodgeLink Interface offers direct access to lodge allotments to the paying client, security is crucial to protect both the client and the lodge manager. Access to the interface is granted by an authenticated login in a secure environment. Once in the Housing Manager/LodgeLink Interface, functionality is limited to

INNfinity V2 sends the Bed Request to its final resting place

a bed request to PTI and waiting for an approval. Alternatively, PTI is no longer stampeded by a herd of bed requests from Esso to corral one-by-one into INNfinity V2. By streamlining the bed request process, PTI and Esso can easily see *without their glasses* a significant savings in time, manpower, and workload, as well as maximum occupancy, reflected in their bottom lines.

Reports

In addition to reservation management, INNfinity V2's Housing Manager/LodgeLink Interface provides a portfolio of user-definable reports to the paying client. Esso Imperial can opt to monitor service days for a given time period, rooms in-house versus those on time-out, booking pace, and occupancy analysis. In addition to these reports, all transactions are recorded with a timestamp and an employee name/number. At any

the role-based security level of the user. Permission is restricted to their given lodge allotment. For example, Esso can only view their allotment within PTI's lodge. PTI allows Esso to make changes to their internal camp reservations up to 24 hours prior to arrival date. Once the timing threshold is reached, subsequent changes to Esso's internal lodge are made by PTI staff only, eliminating any surprises at the front desk. With enforceable business rules and tight security, the Housing Manager/LodgeLink Interface provides a safe camp management environment.

INNfinity V2's Housing Manager/LodgeLink Interface streamlines lodge management by allowing paying clients/contractors to safely access and manage their internal allotments. This increased access saves time and maximizes occupancy for both parties.
